General Description

The FLIR Mobile SDK is a development kit that enables developers to create mobile applications that utilize FLIR APIs to integrate thermal imaging and/or thermal sensing capabilities into their apps. Supported by a robust set of development tools including getting started guides, sample code, help files, online and training videos, developers can create new apps from scratch or add thermal imaging/sensing functionality into existing applications that will work with a broad range of FLIR thermography cameras and select meters.

The FLIR Mobile SDK is:

Powerful. Enables developers to create new apps or update existing apps to add thermal imaging and thermal sensing capabilities – which have the power to completely change the way users see and interact with the world around them.

Capable. Provides support for FLIR ONE products, select WiFi-enabled professional thermography cameras, and also some of FLIR's METERLiNK-enabled test and measurement devices.

Compatible. Provides backward compatibility for existing FLIR ONE apps and enables developers to simply update and recompile them for re-release.

Easy to Use. After a simple SDK download process, our robust set of development tools including getting started guides, sample code, help files, blogs, and training videos make it easy to get started and move your app from "concept" to "published".

Free. Registered and Approved FLIR developers get free access to the FLIR Mobile SDK, the associated FLIR APIs, the entire suite of FLIR Mobile development tools, and technical support for app development.
